

Praise for the book!

This is one of the best math classes I have ever taken. I would have sworn that I could NEVER get statistics, and now I really feel like I understand what I'm doing, which is something I never thought I'd experience in a statistics class. Math is such a hard thing to understand if you get a bad teacher, or one who is unorganized or has unfair or inappropriate materials, so yes, it would be sad if another student another year hated stats because her teacher sucked and the book sucked and the homework sucked, etc. The book is awesome and so easy to read.

I think it would benefit future students. Your book is one they might actually read and if they do they will understand rather than another boring, confusing textbook from the bookstore (not to mention the money it saves us).

I think I learned a lot. I think that the text was extremely beneficial to my learning in this class. You related it very well to the college student- using your relevant examples throughout the book.

It was very beneficial to me, because math and I don't get along and the way this program was designed made it very helpful to me and I am sure that it made it very helpful to others.

Obviously you have spent a lot of time on writing the book and it makes sense, which is a miracle for a math book to make sense to me.

Jay, the book, activities, etc. were all well done. I think that you put a lot of work into everything, and you should receive all the credit, and I think your stuff should be used in the future! You could make big bucks someday! You never know! Thanks!

The resources, ESPECIALLY the CD-ROM (book if you will) really helped and made things easy to understand with real-life examples. Future students could really benefit from these materials. Thanks for the course; I really did learn a lot about real-life situations.

It was a help to me to use a text written by the teacher, and it's impressive to me that you did do all of this work. I do appreciate it, I promise!

I like the book on CD so I think that should be kept for future classes.

I found your text to be VERY helpful in this course. I feel that the activities were helpful and geared towards the undergraduate that doesn't do math for an area of study. These could be very helpful for future students in the class.

I think your format was really helpful.

I took a half of semester of ST307 and then withdrew. That class was the most boring course I have ever taken- I could not even stand to read my book for one page. And I didn't learn anything. Your class has made statistics more exciting and comprehensible.

The department should compensate you for your work in either monetary ways, or with a job, or with some unbelievably good references so that you could get the job you wanted and be head and shoulders above the rest of the applicants.

I thought your text was helpful. It was not the normal, boring, and lame textbook-kind of cheesy but also funny. You have found many ways to relate to students that many professors will never be able to.

I definitely liked the way this class was organized better than I have seen other classes organized. I really liked the text that you made and liked how the assignments and quizzes and exams worked. I think that other students would appreciate it as well.

The book is great! It is such a relief not to have to carry a heavy textbook. It is short and to the point so we don't get bored reading it.

The homework represents the text well, so it is perfect practice. And with the types of examples you use, it's an interesting read. I wouldn't change a thing.

The book is easy to follow and the examples apply to real life, which is great.

I am very impressed that a "math" book can keep me entertained and help me learn!
